Content

程序代写代做 CS编程辅导

→ Foundations & Principles

- Intro, Lambda natural deduction [1,2]
- Higher Order (part 1) [2,3^a]
- Term rewriting [3,4]

→ Proof & Specification Techniques

- Inductively defined sets, rule induction [4,5]
- Datatype induction, primitive recursion [5,7]
- General recursive functions, termination proofs [7^b]
- Proof automation (part 2) [8]
- Hoare logic, proofs about programs, invariants [8,9]
- C verification [9,10]
- Practice, questions, exam prep [10^c]

Datatypes

程序代写代做 CS编程辅导

Example:

Properties:

→ Constructors:

WeChat: cstutorcs

Nil :: 'a list
Cons :: 'a ⇒ 'a list ⇒ 'a list

→ Distinctness:

Nil ≠ Cons x

→ Injectivity:

$(\text{Cons } x \text{ } xs = \text{Cons } y \text{ } ys) = (x = y \wedge xs = ys)$

QQ: 749389476

<https://tutorcs.com>

More Examples

程序代写代做 CS编程辅导

Enumeration:

datatype YesNoMaybe = Yes | No | Maybe

Polymorphic:

datatype WeChat! tutors Option = None | Some 'a
datatype ('a, 'b, 'c) triple = Triple 'a 'b 'c
Assignment Project Exam Help

Recursion:

Email: tutorcs@163.com
datatype 'a list = Nil | Cons 'a "'a list"
QQ: 749389476
datatype 'a tree = Tip | Node 'a "'a tree" "'a tree"
<https://tutorcs.com>

Mutual Recursion:

datatype even = EvenZero | EvenSucc odd

Nested

程序代写代做 CS编程辅导

Nested recursion:

```
datatype 'a tree = Tip | Node 'a "'a tree list"
```

```
datatype 'a tree = Tip | Node 'a "'a tree option" "'a tree  
option"
```

The General Case

程序代写代做 CS编程辅导

datatype $(\alpha_1, \dots, \alpha_n) \tau = C_1 \tau_{1,1} \dots \tau_{1,n_1}$

\dots
 $C_k \tau_{k,1} \dots \tau_{k,n_k}$

- Constructors: $C_1 \tau_{1,1} \dots \tau_{1,n_1} \Rightarrow \dots \Rightarrow \tau_{i,n_i} \Rightarrow (\alpha_1, \dots, \alpha_n) \tau$
- Distinctness: $C_i \dots \neq C_j \dots$ if $i \neq j$
- Injectivity: $(C_i x_1 \dots x_{n_i} = C_i y_1 \dots y_{n_i}) = (x_1 = y_1 \wedge \dots \wedge x_{n_i} = y_{n_i})$

WeChat: cstutorcs

Email: tutorcs@163.com

Distinctness and Injectivity applied automatically

QQ: 749389476

<https://tutorcs.com>

How is this Type Defined?

程序代写代做 CS编程辅导

`datatype`  `= Nil | Cons 'a "'a list"`

- internally reduced to a constructor, using product and sum
- constructor defined as an inductive set (like typedef)
- recursion: least fixed point

WeChat: cstutorcs

Assignment Project Exam Help

More detail: Tutorial on (Co-)datatypes Definitions at isabelle.in.tum.de

Email: tutorcs@163.com

QQ: 749389476

<https://tutorcs.com>

Datatype Limitations

程序代写代做 CS编程辅导

Must be definable as a (non-empty) set.

- Infinitely branching
- Mutually recursive
- Strictly positive (right of function arrow) occurrence ok.

WeChat: cstutorcs

Not ok:

Assignment Project Exam Help

```
datatype t = C (t  $\Rightarrow$  bool)
           | D ((bool  $\Rightarrow$  t)  $\Rightarrow$  bool)
           | E ((t  $\Rightarrow$  bool)  $\Rightarrow$  bool)
```

Email: tutorcs@163.com

QQ: 749389476

Because: Cantor's theorem. set is larger than α

Datatype Limitations

程序代写代做 CS编程辅导

Not ok (nested recursion):

```
datatype ('a, 'b) fun_copy = Fun "'a ⇒ 'b"
```

```
datatype 'a t = t ('a) fun_copy"
```

- recursion in ('a1, ..., 'an) t is only allowed on a subset of 'a1 ... 'an
- these arguments are called *live* arguments
- Mainly: in "'a ⇒ 'b" 'a is dead and 'b is live
- Thus: in ('a, 'b) fun_copy, 'a is dead and 'b is live
- type constructors must be registered as BNFs* to have live arguments
- BNF defines well-behaved type constructors, ie where recursion is allowed
- datatypes automatically are BNFs (that's how they are constructed)
- can register other type constructors as BNFs — not covered here**

* BNF — Bounded Natural Functors

Case

程序代写代做 CS编程辅导

Every datatype introduces a **case** construct, e.g.

(case xs of

| y #ys \Rightarrow ... y ... ys ...)

In general: one case per constructor

WeChat: cstutorcs

- Nested patterns allowed: $x \# y \# zs$
- Dummy and default patterns with `_`
- Binds weakly, needs `()` in context

Why nontermination can be harmful

程序代写代做 CS编程辅导

$f\ x = f\ x + 1?$
Subtract $f\ x$ on both sides.

WeChat: cstutorcs

\implies
Assignment Project Exam Help
 $0 = 1$

Email: tutorcs@163.com

! All functions in HOL must be total !
QQ: 749389476
<https://tutorcs.com>

Primitive Recursion

程序代写代做 CS编程辅导

primrec gl termination structurally

Example primrec d

WeChat: cstutorcs

primrec app :: "'a list \Rightarrow 'a list \Rightarrow 'a list"

where Assignment Project Exam Help

"app Nil ys = ys" |

Email: tutorcs@163.com
"app (Cons x xs) ys = Cons x (app xs ys)"

QQ: 749389476

<https://tutorcs.com>

The General Case

程序代写代做 CS编程辅导

If τ is a datatype (with constructors C_1, \dots, C_k) then $f :: \tau \Rightarrow \tau'$ can be defined by **primitive recursion**:

$$f(C_1 y_{1,1} \dots y_{1,n_1}) = r_1$$

\vdots

$$f(C_k y_{k,1} \dots y_{k,n_k}) = r_k$$

Email: tutorcs@163.com

The recursive calls in r_i must be **structurally smaller**

(of the form $f a_1 \dots y_{i,j} \dots a_p$)

<https://tutorcs.com>

How does this Work?

程序代写代做 CS编程辅导

primrec just  ax for a **recursion operator**

Example: $\text{rec_list } f_1 f_2 ('b \Rightarrow 'b \text{ list} \Rightarrow 'a \Rightarrow 'a) \Rightarrow 'b \text{ list} \Rightarrow 'a$

$\text{rec_list } f_1 f_2 = f_1$

$\text{rec_list } f_1 f_2 (\text{Cons } x \text{ } xs) = f_2 \ x \ xs \ (\text{rec_list } f_1 f_2 \ xs)$

WeChat: cstutores

$\text{app} \equiv \text{rec_list } (\lambda \text{ } ys. \text{ } ys) (\lambda \text{ } x \text{ } xs \text{ } xs'. \lambda \text{ } ys. \text{Cons } x \text{ } (xs' \text{ } ys))$

Assignment Project Exam Help

primrec $\text{app} :: "'a \text{ list} \Rightarrow 'a \text{ list} \Rightarrow 'a \text{ list}"$

Email: tutores@163.com

where

$"\text{app } f \text{ } ys = ys"$

QQ: 749389476

$"\text{app } (\text{Cons } x \text{ } xs) \text{ } ys = \text{Cons } x \text{ } (\text{app } xs \text{ } ys)"$

https://tutores.com

rec_list

程序代写代做 CS编程辅导

Defined: automatically inductively (set), then by epsilon

$$\frac{(xs, xs') \in \text{list_rel } f_1 \ f_2}{(\text{Nil}, f_1) \in \text{list_rel } f_1 \ f_2 \quad (\text{Cons } x \ xs, f_2 \ x \ xs \ xs') \in \text{list_rel } f_1 \ f_2}$$

WeChat: cstutorcs

Assignment Project Exam Help

$\text{rec_list } f_1 \ f_2 \ x \ y \rightarrow (xs, y) \in \text{list_rel } f_1 \ f_2$

Automatic proof that set def indeed is total function

(the equations for rec_list are lemmas!)

Option

程序代写代做 CS编程辅导

`datatype 'a option = None | Some 'a`

Important application

`'b ⇒ a option` \sim partial function:

`None` \sim no result

`Some a` \sim result `a`

Assignment Project Exam Help

Example:

`primrec lookup :: 'k ⇒ ('k × 'v) list ⇒ 'v option`

where

`lookup k [] = None`

`lookup k (x #xs) = (if 1st x = k then Some (snd x) else lookup k xs)`

<https://tutores.com>

Structural induction

程序代写代做 CS编程辅导

P xs holds for all lists xs if

- P Nil
- and for arbitrary x and list xs P xs $\implies P$ ($x \# xs$)

Induction theorem:

$$[[P []; \bigwedge a \text{ list. } P \text{ list} \implies P (a \# \text{list})]] \implies P \text{ list}$$

- General proof method for induction. (**Induct x**)
 - x must be a free variable in the first subgoal.
 - type of x must be a datatype.

Exercises

程序代写代做 CS编程辅导

- define a primitive function **lsum** :: nat list \Rightarrow nat that returns the sum of the elements in a list.
- show " $2 * \text{lsum } [0..n] = n * (n + 1)$ "
- show " $\text{lsum } (\text{replicate } n \ a) = n * a$ "
- define a function **lsumT** using a tail recursive version of listsum.
- show that the two functions are equivalent: $\text{lsum } xs = \text{lsumT } xs$
