## How to Decide $l \xrightarrow{*} r$

程序代写代做 CS编程辅导

Same idea as for  $\beta$ : look for  $n$  such that  $l \xrightarrow{*} n$  and  $r \xrightarrow{*} n$

Does this always work?

If  $l \xrightarrow{*} n$  and  $r \xrightarrow{*} n$ , then  $l \xrightarrow{*} r$ . Ok.

If  $l \xrightarrow{*} r$ , will there always be a suitable  $n$ ? **No!**

WeChat: cstutorcs

Example:

Rules:  $f x \rightarrow a$  and  $g x \rightarrow b$  then  $f (g x) \rightarrow b$   
 $f x \xrightarrow{*} g x$  because  $f x \rightarrow a \leftarrow f (g x) \rightarrow b \leftarrow g x$

**But:**  $f x \rightarrow a$  and  $g x \rightarrow b$  and  $a, b$  in normal form

Works only for systems with Church-Rosser property:

$$l \xrightarrow{*} r \implies \exists n. l \xrightarrow{*} n \wedge r \xrightarrow{*} n$$

**Fact:**  $\xrightarrow{*}$  is Church-Rosser iff it is confluent.

# Confluence

程序代写代做 CS编程辅导

m:

ven set of reduction rules conflu-

undecidable

WeChat: cstutorcs

Local Confluence

Assignment Project Exam Help

Email: [tutorcs@163.com](mailto:tutorcs@163.com)

QQ: 749389476

<https://tutorcs.com>

**Fact:** local confluence and termination  $\implies$  confluence

# Termination

程序代写代做 CS编程辅导

- is **terminating** if there are no infinite reduction chains
- is **normalizing** if every element has a normal form
- is **convergent** if it is terminating and confluent

## Example:

WeChat: cstutorcs

- $\beta$  in  $\lambda$  is not terminating, but confluent
- $\beta$  in  $\lambda \rightarrow$  is terminating and confluent, i.e. convergent

Email: [tutorcs@163.com](mailto:tutorcs@163.com)

**Problem:** is a given set of reduction rules terminating?

QQ: 749389476

<https://tutorcs.com>

undecidable

## When is $\rightarrow$ Terminating?

程序代写代做 CS编程辅导

**Basic idea:** when each application makes terms simpler in some way.

**More formally:**  $\rightarrow$  is terminating when there is a well founded order  $<$  on terms for which  $s < t$  whenever  $t \rightarrow s$   
(well founded = no infinite decreasing chains  $a_1 > a_2 > \dots$ )

**Example:**  $f(g\ x) \rightarrow g\ x, g(f\ x) \rightarrow f\ x$

This system always terminates. Reduction order:

$s <_r t$  iff  $\text{size}(s) < \text{size}(t)$  with

$\text{size}(s)$  = number of function symbols in  $s$

- ① Both rules always decrease size by 1 when applied to any term  $t$
- ②  $<_r$  is well founded because  $<$  is well founded on  $\mathbb{N}$

https://tutorcs.com

## Termination in Practice

程序代写代做 CS编程辅导

**In practice:** often easier to consider just the rewrite rules by themselves,

rather than their  $\rightarrow$  to an arbitrary term  $t$ .

**Show** for each rule  $/$  it  $r_i < l_i$ .

**Example:**

$g\ x < f\ (g\ x)$  and  $f\ x < g\ (f\ x)$

WeChat: cstutorcs

**Requires**

$u$  to become smaller whenever any subterm of  $u$  is made smaller.

Assignment Project Exam Help

Email: tutors@163.com

**Formally:**

Requires  $<$  to be **monotonic** with respect to the structure of terms:

$s < t \longrightarrow u[s] < u[t]$ .

QQ: 749389476

<https://tutorcs.com>

True for most orders that don't treat certain parts of terms as special cases.

## Example Termination Proof

程序代写代做 CS编程辅导

**Problem:** Rewrite formulas containing  $\neg$ ,  $\wedge$ ,  $\vee$  and  $\longrightarrow$ , so that they don't contain any implications and  $\neg$  is applied only to variables and constants.

### Rewrite Rules:

- Remove implications

$$\text{imp: } (A \longrightarrow B) = (\neg A \vee B)$$

- Push  $\neg$ s down past other operators:

$$\text{notnot: } (\neg \neg P) = P$$

$$\text{notand: } (\neg (A \wedge B)) = (\neg A \vee \neg B)$$

$$\text{notor: } (\neg (A \vee B)) = (\neg A \wedge \neg B)$$

We show that the rewrite system defined by these rules is terminating.

## Order on Terms

程序代写代做 CS编程辅导

Each time one of our rules is applied, either:

- an implication is
- something that is hoisted upwards in the term.

This suggests a 2-pairing  $<_r$ :  $s <_r t$  iff:

- $\text{num\_imps } s < \text{num\_imps } t$ , or
- $\text{num\_imps } s = \text{num\_imps } t \wedge \text{osize } s < \text{osize } t$ .

Let:

- $s <_i t \equiv \text{num\_imps } s < \text{num\_imps } t$  and
- $s <_n t \equiv \text{osize } s < \text{osize } t$

Then  $<_i$  and  $<_n$  are both well-founded orders (since both return nats).

$<_r$  is the lexicographic order over  $<_i$  and  $<_n$ .  $<_r$  is well-founded since  $<_i$  and  $<_n$  are both well-founded.

<https://tutormcs.com>

## Order Decreasing

程序代写代做 CS编程辅导

**imp** clearly decreases  $\text{osize}$ .

$\text{osize}$  adds up all non-variables/ constants, weights each one according to its position within the term.

$$\text{osize}' c = 2^x$$

$$\text{osize}' (\neg P) = \text{osize}' P (x+1)$$

$$\text{osize}' (P \wedge Q) = 2^x + (\text{osize}' P (x+1)) + (\text{osize}' Q (x+1))$$

$$\text{osize}' (P \vee Q) = 2^x + (\text{osize}' P (x+1)) + (\text{osize}' Q (x+1))$$

$$\text{osize}' (P \rightarrow Q) = 2^x + (\text{osize}' P (x+1)) + (\text{osize}' Q (x+1))$$

$$\text{osize}' P = \text{osize}' P 0$$

The other rules decrease the depth of the things  $\text{osize}$  counts, so decrease  $\text{osize}$ .

# Term Rewriting in Isabelle

程序代写代做 CS编程辅导

Term rewriting in Isabelle is called **Simplifier**

ply simp

→ uses simplification rules

→ (almost) blindly from left to right

→ until no rule is applicable

Email: [tutorcs@163.com](mailto:tutorcs@163.com)

**termination:** not guaranteed

(may loop)

**confluence:** not guaranteed

(result may depend on which rule is used first)

# Control

## 程序代写代做 CS编程辅导

- Equations turned into simplification rules with **[simp]** attribute
- Adding/deleting equations locally:  
**apply** (simp add: <rules>) and **apply** (simp del: <rules>)
- Using only the specified set of equations:  
**apply** (simp only: <rules>)
