Content

程序代写代做 CS编程辅导

→ Foundations & Principles

- Intro, Lambda natural deduction [1,2]
- Higher Order (part 1) [2,3^a]
- Term rewriting [3,4]

→ Proof & Specification Techniques

- Inductively defined sets, rule induction [4,5]
- Datatype induction, primitive recursion [5,7]
- General recursive functions, termination proofs [7^b]
- Proof automation (part 2) [8]
- Hoare logic, proofs about programs, invariants [8,9]
- C verification [9,10]
- Practice, questions, exam prep [10^c]

General Recursion

程序代写代做 CS编程辅导

Choice

→ Limited expressiveness, automatic termination

- `primrec`

WeChat: cstutorcs

→ High expressiveness, termination proof may fail

- `fun`

Assignment Project Exam Help

Email: tutorcs@163.com

→ High expressiveness, tweakable, termination proof manual

- `function`

QQ: 749389476

<https://tutorcs.com>

fun — examples

程序代写代做 CS编程辅导

```
fun sep :: "'a ⇒ 'a list"
where
  "sep a (x # y # xs) = a # sep a (y # xs)" |
  "sep a xs = xs"
```

WeChat: cstutorcs

```
fun ack :: "nat ⇒ nat ⇒ nat"
where
```

Assignment Project Exam Help

```
  "ack 0 n = Suc n" |
  "ack (Suc m) 0 = ack m 1" |
  "ack (Suc m) (Suc n) = ack m (ack (Suc m) n)"
```

Email: tutorcs@163.com

QQ: 749389476

<https://tutorcs.com>

fun

程序代写代做 CS编程辅导

→ More permissive than `primrec`:

- pattern matching on parameters
- nested, linear or patterns
- reads equations sequentially like in Haskell (top to bottom)
- proves termination automatically in many cases (tries lexicographic order)

WeChat: tutores

→ Generates more theorems than `primrec`

Assignment Project Exam Help

→ May fail to prove termination:

- use **function** (**sequential**) instead
- allows you to prove termination manually

Email: tutores@163.com

QQ: 749389476

<https://tutores.com>

fun — induction principle

程序代写代做 CS编程辅导

- Each **fun** definition has an induction principle
- For each equation $\text{fun } f \text{ where } \text{eqns}$ show P holds for f and P holds for each recursive call on rhs

- Example **sep.induct**:

$$\begin{aligned} & \llbracket \bigwedge a. P\ a \rrbracket; \\ & \bigwedge a\ w. P\ a\ [w] \\ & \bigwedge a\ x\ y\ zs. P\ a\ (y\#\!zs) \implies P\ a\ (x\#\!y\#\!zs); \\ & \rrbracket \implies P\ a\ xs \end{aligned}$$

Termination

程序代写代做 CS编程辅导

Isabelle tries to prove termination automatically

- For most functions with a lexicographic termination relation.
- Sometimes not ⇒ Usage with unsolved subgoal
- You can prove termination separately.

function (sequential) quicksort where

quicksort [] = [] |

quicksort (x#xs) = quicksort [y ← xs.x < y]

[y ← xs.x < y]

by pat_completeness auto

termination

by (relation "measure length") (auto simp: less_Suc_eq_le)

How does fun/function work?

程序代写代做 CS编程辅导

Recall **primrec**:

- defined one recursive function for per datatype D
- inductive definition: $\text{graph } (x, f \ x) \in D_rel$
- prove totality: $\forall x. \exists y. (x, y) \in D_rel$
- prove uniqueness: $(x, y) \in D_rel \Rightarrow (x, z) \in D_rel \Rightarrow y = z$
- recursion operator for datatype D_rec , defined via *THE*.
- primrec: apply datatype recursion operator

How does fun/function work?

程序代写代做 CS编程辅导

Similar strategy for **f**

- a new inductive definition for each **fun** f
- extract *recursion* equations in f
- define graph f_rel inductively, encoding recursion scheme
- prove totality (= termination)
- prove uniqueness (automatic)
- derive original equations from f_rel
- export induction scheme from f_rel

How does fun/function work?

程序代写代做 CS编程辅导

function can separate  for termination proof:

- skip proof of totality
- instead derive equations of the form: $x \in f_dom \Rightarrow f\ x = \dots$
- similarly, conditional recursion principle
- $f_dom = acc\ f_rel$
- acc = accessible part of f_rel
- the part that can be reached in finitely many steps
- termination = $\forall x. x \in f_dom$
- still have conditional equations for partial functions

Proving Termination

程序代写代做 CS编程辅导

termination `fun_name` `fun_name` termination goal

$\forall x. x \in \text{fun_name_dom}$

Three main proof methods

- **lexicographic_order** (default tried by **fun**)
- **size_change** (automated translation to simpler size-change graph¹)
- **relation R** (manual proof via well-founded relation)

The Size-change Principle for Program Termination, POPL 2001.

Well Founded Orders

程序代写代做 CS编程辅导

Definition

$<_r$ is well founded iff well founded induction holds
 $wf(<_r) \equiv \forall P. (\forall x. (\forall y. y <_r x \rightarrow P y) \rightarrow P x) \rightarrow (\forall x. P x)$

Well founded induction rule:

$$\frac{wf(<_r) \quad \bigwedge x. (\forall y. y <_r x. P y) \implies P x}{P x}$$

Assignment Project Exam Help

Alternative definition (equivalent).

there are no infinite descending chains, or (equivalent):
every nonempty set has a minimal element wrt $<_r$

$$\min(<_r) Q x \equiv \forall y. y \in Q. y \not<_r x$$

$$wf(<_r) = (\forall Q \neq \{\}. \exists m \in Q. \min r Q m)$$

Well Founded Orders: Examples

程序代写代做 CS编程辅导

- $<$ on \mathbb{N} is well founded
- well founded induction is complete induction
- $>$ and \leq on \mathbb{N} are well founded
- $x <_r y = x \text{ dvd } y \wedge x \neq 1$ on \mathbb{N} is well founded
the minimal elements are the prime numbers
- $(a, b) <_r (x, y) = a <_1 x \vee a = x \wedge b <_2 y$ is well founded
if $<_1$ and $<_2$ are well founded
- $A <_r B = A \subset B \wedge \text{finite } B$ is well founded
- \subseteq and \subset in general are **not** well founded

Extracting the Recursion Scheme

程序代写代做 CS编程辅导

So far for terminating recursion, what about the recursion scheme?
Not more as in **primrec**.

Examples:

- **fun fib where** WeChat: cstutorcs
fib 0 = 1 |
fib (Suc 0) = 1 | Assignment Project Exam Help
fib (Suc (Suc n)) = fib n + fib (Suc n)
Email: tutores@163.com
Recursion: $\text{Suc} (\text{Suc } n) \leadsto n, \text{Suc} (\text{Suc } n) \leadsto \text{Suc } n$
- **fun f where** QQ: 749389476
 $f x = (if\ x = 0\ then\ 1\ else\ f\ (x - 1) * 2)$
Recursion: $x \neq 0 \implies x \leadsto x - 1$
https://tutores.com

Extracting the Recursion Scheme

程序代写代做 CS编程辅导

Higher Order:

→ **datatype** 'a tree = Branch 'a tree list
fun treemap :: ('a ⇒ 'b) ⇒ 'a tree ⇒ 'b tree **where**
treemap fn (Leaf n) = Leaf (fn n) |
treemap fn (Branch l) = Branch (map (treemap fn) l)

WeChat: cstutorcs

Recursion: $x \in \text{set } l \implies (fn, \text{Branch } l) \rightsquigarrow (fn, x)$
Assignment Project Exam Help

Email: tutorcs@163.com

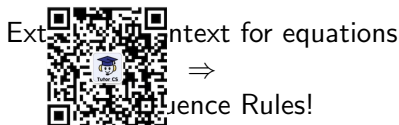

How does Isabelle extract context information for the call?

QQ: 749389476

<https://tutorcs.com>

Extracting the Recursion Scheme

程序代写代做 CS编程辅导

Recall rule **if_cong**: **WeChat: cstutorcs**

$$\begin{aligned} & \llbracket b = c; c \implies x = u; \neg c \implies x = v \rrbracket \implies \\ & (\text{if } b \text{ then } x \text{ else } y) = (\text{if } c \text{ then } u \text{ else } v) \end{aligned}$$

Assignment Project Exam Help
Email: tutors@163.com

Read: for transforming x , use b as context information, for y use $\neg b$.

In fun_def: for recursion in x , use b as context, for y use $\neg b$.

Congruence Rules for fun_defs

程序代写代做 CS编程辅导

The same rule for function definitions.

`def_fundef_cong` rule[fundef_cong]
(if_cy added by default)

WeChat: cstutorcs

Another example (higher-order):

$$[| xs = ys; \bigwedge x. x \in \text{set } ys \Rightarrow f x = g x |] \Rightarrow \text{map } f xs = \text{map } g ys$$

Email: tutorcs@163.com

Read: for recursive calls in f , f is called with elements of xs
